The Path to Better Passing

*An Evidence-Based Guide for Parents &
Coaches*

In a typical youth soccer game, a player might touch the ball 30-50 times. The vast majority of those touches involve receiving or passing. Master these, and you've mastered the foundation of the game.

About Aspire Sports	89

This guide combines cutting-edge research in motor learning, perceptual-cognitive development, and youth coaching to give you a clear, evidence-based path to help your young player become a confident, intelligent passer.

What Makes This Different

- Every technique is backed by peer-reviewed research
- Focuses on decision-making, not just mechanics
- Treats receiving and passing as one connected skill
- Age-appropriate progressions based on developmental science

- Emphasizes scanning and awareness—the hidden skill of great passers

PART ONE

What the Research Tells Us

Understanding How Children Learn to Pass

Passing Is Perception + Action

Most people think of passing as a technical skill—striking the ball with the right part of the foot, the right weight, to the right spot. But research reveals that passing is primarily a perceptual-cognitive skill.

A landmark study by Roca and colleagues (2011) compared elite and sub-elite youth players. The difference wasn't in their ability to strike a ball accurately—it was in their ability to see and process information before the ball arrived.

Great passers know where to pass before they receive. The technique is the easy part.

RESEARCH FINDING

"Elite youth players demonstrated superior anticipation and decision-making, using more efficient visual search strategies and generating more accurate expectations about what would happen next."

Roca, A., Ford, P.R., McRobert, A.P., & Williams, A.M. (2011). Identifying the processes underpinning anticipation and decision-making in a dynamic time-constrained task. Cognitive Processing, 12(3), 301-310.

PARENT TAKEAWAY

When you watch your child play, don't just watch their passing technique. Watch what they're doing BEFORE the ball arrives. Are they scanning? Do they seem to know what they'll do next? That's the real skill.

The First Touch Revolution

Here's a secret that elite coaches know: the quality of a pass is determined by the quality of the first touch that received the previous pass.

Research on professional players shows that a poor first touch reduces passing accuracy by up to 30% and increases turnover rate dramatically. This is why modern coaching treats receiving and passing as a single, connected skill—not two separate ones.

The old model: Receive. Stop. Look. Pass. The new model: Scan. Prepare. Receive-to-pass.

RESEARCH FINDING

"First touch quality was the strongest predictor of successful subsequent actions, more important than speed, position, or pressure from opponents."

Pulling, C., Eldridge, D., Ringshall, E., & Robins, M.T. (2018). Analysis of crossing and finishing in the FA Women's Super League 2015/2016. International Journal of Performance Analysis in Sport, 18(6), 1026-1037.

Implications

- Receiving practice should always include a subsequent action (pass, turn, or dribble)
- Players should be scanning before the ball arrives, not after
- The body position when receiving determines passing options
- A good first touch is one that sets up the next action—not one that just controls the ball

Scanning: The Hidden Skill

Research by Geir Jordet and colleagues has transformed how we understand elite passing. They studied professional midfielders using GPS tracking and video analysis, counting how often players scanned (looked away from the ball) before receiving.

The findings were striking: players who scanned more frequently before receiving completed significantly more forward passes and had higher pass completion rates.

Even more interesting—scanning is trainable. Players can dramatically improve their scanning frequency with deliberate practice.

RESEARCH FINDING

""Top Premier League midfielders scanned an average of 0.62 times per second before receiving, compared to 0.45 for average players. Each additional scan increased the likelihood of a successful forward pass by 6%.""

Jordet, G., Bloomfield, J., & Heijmerikx, J. (2013). The hidden foundation of field vision in English Premier League (EPL) soccer players. MIT Sloan Sports Analytics Conference.

Scanning Development Progression

LEVEL	CHARACTERISTIC	HOW TO DEVELOP
Beginner	Ball-focused; rarely looks away from play	Simple awareness games: 'How many fingers am I holding up?'
Developing	Scans occasionally after receiving	Freeze games: 'Point to where your teammates are'
Competent	Scans before receiving	Conditional passing: action depends on what they see before receiving
Advanced	Continuous scanning, multiple checks	High-tempo positional games, increased decision complexity

FOR PARENTS

You can help develop scanning at home! When playing together, occasionally ask 'Where was I standing?' after a pass. Make awareness a game, not a test.

Why Game-Based Training Works

Traditional passing training often looks like this: Players line up, pass to a partner, partner receives, passes back. Repeat. This is called 'blocked practice'—and research shows it's one of the least effective ways to learn.

Studies by Ford and colleagues analyzed youth academies across Europe and found a clear pattern: the academies that produced the best players spent more time in game-based activities and less time in isolated drills.

Why? In games, players must solve passing problems in context—with defenders, with movement, with time pressure. These are the conditions where real passing skills develop.

RESEARCH FINDING

""Professional youth academies spent 65% of training time in game-based activities compared to 20% at amateur clubs. This playing-form practice was associated with skill acquisition and future success.""

Ford, P.R., Yates, I., & Williams, A.M. (2010). An analysis of practice activities and instructional behaviours used by youth soccer coaches during practice. Journal of Sports Sciences, 28(5), 483-495.

TRADITIONAL APPROACH

10 minutes of passing in pairs, focusing on technique. Players stand still, 10 yards apart.

EVIDENCE-BASED APPROACH

*4v4 game where the team scores a point for completing 5 consecutive passes.
Progression: now passes must be one-touch.*

Why it works: In the game, players must scan, move, communicate, and execute under pressure—all the real components of passing. The technique adapts to serve the tactical need.

External Focus: The Better Way to Coach

When coaching passing, there's a temptation to focus on body mechanics: 'Lock your ankle,' 'Plant foot next to the ball,' 'Follow through to your target.'

Research consistently shows this internal focus is less effective than external focus—directing attention to the effects of the movement rather than the body parts involved.

The difference is profound. Internal focus can actually interfere with natural movement patterns, while external focus allows the body to self-organize toward the goal.

RESEARCH FINDING

""An external focus of attention (on the movement effect) consistently outperforms an internal focus (on body movements) for motor learning and performance, across tasks, skill levels, and populations.""

Wulf, G. (2013). Attentional focus and motor learning: A review of 15 years. International Review of Sport and Exercise Psychology, 6(1), 77-104.

Better Coaching Cues

INSTEAD OF SAYING...	TRY SAYING...
Strike through the middle of the ball	Make the ball stay low and reach your partner's feet
Lock your ankle when you pass	Make a firm, crisp sound when the ball leaves
Keep your body over the ball	Keep the pass on the ground
Follow through toward your target	Send the ball exactly where you want it to arrive

The Power of Variability

Should players practice the same pass over and over until it's perfect? Research says no.

The contextual interference effect shows that variable practice—mixing up distances, angles, speeds, and situations—leads to better learning and transfer than repetitive practice, even though it looks messier during training.

For passing, this means: don't just practice 10-yard passes to a stationary target. Mix short and long, moving and still, ground and lofted, under pressure and with time.

RESEARCH FINDING

""Random practice conditions (high contextual interference) produced superior retention and transfer compared to blocked practice, despite appearing less effective during acquisition.""

Shea, J.B., & Morgan, R.L. (1979). Contextual interference effects on the acquisition, retention, and transfer of a motor skill. Journal of Experimental Psychology: Human Learning and Memory, 5(2), 179-187.

PARENT TAKEAWAY

Don't worry if practice looks messy or inconsistent. That variability is exactly what builds adaptable, game-ready passing skills.

Variability Principles

- Vary the distance: short, medium, long in the same session
- Vary the angle: square, diagonal, backward, switching sides
- Vary the pressure: space, time, defender proximity
- Vary the context: different small-sided game setups
- Vary the surface: left foot, right foot, outside of foot

The Boy Who Saw Everything

Xavi Hernández and the Art of Vision

In the youth academy of FC Barcelona, there was a boy who didn't run faster than anyone else. He wasn't particularly tall or strong. But the coaches noticed something unusual: he always seemed to know what was going to happen next.

His name was Xavi Hernández, and by the time he retired, many considered him the greatest passer in the history of football.

"I'm always looking, always moving my head," Xavi explained in an interview. "Before I get the ball, I've already checked my shoulder four, five, six times. I know where everyone is."

Watch any video of Xavi playing, and you'll see it: the constant scanning, the head moving like a periscope, gathering information. By the time the ball arrived at his feet, he had already made his decision.

What made Xavi special wasn't natural talent—it was a habit developed over thousands of hours at La Masia, Barcelona's academy. The coaches there didn't just teach technique. They taught players to think, to see, to understand the game.

"The first thing I look for is the diagonal pass forward," Xavi said. "If it's there, I play it. If not, I look for the switch. If not, I go back. But I see it all before the ball comes."

For young players, Xavi's story isn't about being born with special vision. It's about developing a habit of scanning, of always knowing your options, of preparing to play before the ball arrives.

The next time your child watches a professional game, have them watch a midfielder's head instead of the ball. They'll see the secret that Xavi mastered—the game is won in the moments before the pass, not during it.

"Think quickly, look for spaces. That's what I do: look for spaces. All day. I'm always looking." — *Xavi Hernández*

Building a Passing Culture

Pep Guardiola — Former Barcelona, Bayern Munich, and Manchester City Manager

When Pep Guardiola took over Barcelona in 2008, he inherited a squad full of talented players. His first message to them was simple and surprising: "We are going to pass the ball more than any team in history."

Not score more goals. Not win more trophies. Pass more.

Guardiola understood something profound about passing: it isn't just a way to move the ball, it's a way of controlling the game. When you have the ball, the opponent cannot score. When you pass it well, you dictate the rhythm, the space, the entire flow of the match.

"For me, the definition of a good team is one that can pass the ball in every situation," Guardiola explained. "Under pressure, in tight spaces, when tired—they still pass correctly."

His training sessions reflected this philosophy. Every exercise included passing under pressure. Players were constantly asked: "Why did you pass there? What did you see?"

But Guardiola's genius wasn't just tactical—it was psychological. He made players believe that passing well was the highest form of football intelligence. It wasn't something for players who couldn't dribble or shoot. It was the art form that made everything else possible.

For youth coaches, Guardiola's approach offers a powerful framework: create an environment where passing is celebrated,

where ball retention is valued, where players understand that the best teams are the ones who keep the ball.

"In the end, the ball is the most important thing. The team that controls the ball controls the game." — *Pep Guardiola*

Key Principle: Passing isn't a limitation—it's a superpower.

PART TWO

The Passer's Mindset

Vision, Courage, and Composure

Great passers aren't just technically skilled—they see the game differently, trust their decisions, and stay calm under pressure. This section covers the psychological foundations of intelligent passing.

Playing With Your Head Up

Many young players pass to the first option they see—usually the closest teammate. This is safe, but it limits the team's ability to progress. Elite passers see multiple options and select the best one.

Research shows this isn't about processing speed—it's about what players look for. Good passers have developed scanning habits that reveal options poor passers never see.

The good news: this is entirely trainable. With the right practice design, players can dramatically expand their vision.

RESEARCH FINDING

""Expert players used more efficient visual search strategies, fixating on more informative areas of the display and extracting information more quickly than novices.""

Williams, A.M., & Davids, K. (1998). Visual search strategy, selective attention, and expertise in soccer. Research Quarterly for Exercise and Sport, 69(2), 111-128.

Developing Vision

- Small-sided games with targets in multiple locations
- Conditional games: 'If you receive facing forward, play forward; if not, switch the play'
- Scanning challenges: call out information before receiving
- Video analysis: watch professional players and discuss what they see

The Courage to Play Forward

Many young players default to safe passes—sideways or backward—even when forward options exist. This often stems from fear of making mistakes or losing possession.

Research on achievement motivation shows that players who focus on mastery (learning and improving) rather than performance (looking good, avoiding mistakes) are more likely to take appropriate risks.

The environment adults create—how we respond to turnovers, what we praise—shapes whether players develop the courage to play forward.

RESEARCH FINDING

""Athletes with growth mindsets—who view abilities as developable—take more appropriate risks, persist through setbacks, and ultimately achieve higher levels of performance.""

Dweck, C.S. (2006). Mindset: The New Psychology of Success. Random House.

✓ What Promotes Good Passing Mindset

- Praising forward passes even when they don't succeed
- Celebrating the decision, not just the outcome
- Analyzing turnovers as learning moments, not failures
- Sharing examples of great players who take risks

✗ What Undermines It

- Reacting negatively to turnovers from forward passes
- Praising only safe, successful passes
- Emphasizing possession percentage over penetration
- Comparing to teammates who play more conservatively

Composure Under Pressure

The best passers in the world don't panic when pressed. They seem to have more time than everyone else. Is this

a gift? Research says no—it's a skill.

Studies of expert performers show that staying calm under pressure involves both perceptual skills (seeing options earlier) and psychological skills (managing arousal and attention).

When players feel rushed, their scanning decreases, their options narrow, and they make poorer decisions. The key is maintaining effective search strategies even under pressure.

RESEARCH FINDING

"Pressure causes performers to shift attention inward, explicitly monitoring skills that normally run automatically. This disrupts fluid execution and decision-making."

Beilock, S.L., & Carr, T.H. (2001). On the fragility of skilled performance: What governs choking under pressure? Journal of Experimental Psychology: General, 130(4), 701-725.

Building Composure

Progressive pressure training

Gradually increase time pressure and defensive intensity in training

Research: Systematic desensitization builds stress inoculation

Quiet eye training

Hold visual focus on key information longer before executing

Research: Extended quiet eye periods correlate with successful performance under pressure

Process focus cues

Focus on 'what to do' (scan, body open, play forward) not outcomes

Research: Process focus reduces anxiety and maintains execution

Reading the Rhythm of the Game

Soccer isn't played at one speed. Great passers understand when to speed up play and when to slow it down. This game intelligence develops through experience and guided reflection.

Young players often play at one tempo—usually fast. Learning to vary the rhythm, to recognize when the team needs to breathe versus when to attack, is a hallmark of intelligent players.

This can't be taught through drills. It emerges through game experience and conversations about why certain moments called for certain decisions.

RESEARCH FINDING

""Tactical decision-making develops through experience in representative game contexts combined with guided discovery and reflection, not through explicit instruction alone.""

Grehaigne, J.F., Godbout, P., & Bouthier, D. (2001). The teaching and learning of decision making in team sports. Quest, 53(1), 59-76.

Developing Game Rhythm

- Post-game discussions: 'When did we need to slow down? Speed up?'
- Watch professional games together, discussing tempo changes
- Games with tempo constraints: 30 seconds of keep-away, then 30 seconds to score
- Recognize when teammates are in good positions vs. recovering

The Calm in the Storm

Andrea Pirlo and the Power of Composure

In the 2006 World Cup Final, with the weight of Italy on his shoulders, Andrea Pirlo did something remarkable: he played as if he were in his backyard.

While others rushed and panicked under the pressure of the biggest game in football, Pirlo glided across the pitch, stroking passes with perfect weight, always finding the right option. Italy won, and Pirlo was named the tournament's best player.

"I don't feel pressure," Pirlo once said, in his characteristically understated way. "People who feel pressure don't know how to play football."

But this composure wasn't something Pirlo was born with. It was built through a specific kind of development.

As a young player at Brescia, Pirlo's coaches noticed his technical ability but also his tendency to overcomplicate things. They gave him a simple instruction that would shape his entire career: "See the simple pass. Play it."

Pirlo learned that composure comes from clarity. When you see the game clearly—when you've scanned, when you know your options—there's no reason to panic. The solution is already there.

"The best pass is the right pass," Pirlo explained. "Sometimes that's a 40-yard diagonal. Sometimes it's a five-yard square ball. The important thing is to know which is which."

For young players, Pirlo's lesson is powerful: composure isn't the absence of pressure, it's the presence of preparation. When you

know what you're going to do before the ball arrives, the situation feels manageable. When you don't, everything feels rushed.

His famous quote captures it perfectly: "I'm not a fast player. But the ball, it's fast."

"I don't have to run. The ball does the work." — *Andrea Pirlo*

PART THREE

Seeing the Pass

When, Where, and Why

A player who can execute any pass but doesn't know when to use each one isn't a good passer—they're just technically capable. True passing mastery includes understanding context.

The Passing Decision Framework

Every time a player receives the ball, they face a decision: What should I do with it? Research on expert decision-making shows that better players don't process faster—they see fewer, better options because they've learned what to look for.

Rather than teaching a rigid decision tree, we want players to ask the right questions instinctively.

RESEARCH FINDING

""Expert decision-makers in dynamic environments use recognition-primed decision making—they recognize patterns from experience and simulate options rapidly rather than comparing all alternatives.""

Klein, G. (1999). Sources of Power: How People Make Decisions. MIT Press.

The Passing Decision Framework

Where is the space? Where is the danger?

This determines body position and first touch direction

Can I play forward? Is a teammate free and ready?

Forward progress is usually more valuable than safety

Can I switch the play? Can I bounce and move?

Changing the point of attack or resetting creates new options

Can I turn? If not, can I find my safe option?

Knowing your 'out' allows composure; turning when possible is high-value

Types of Passes and Their Uses

Not all passes are created equal. Each type of pass has tactical applications, and understanding when to use each is part of game intelligence.

Young players often have a default—usually a simple push pass—and use it everywhere. Developing a repertoire of passes for different situations expands their ability to solve problems.

Types of Passes

PASS TYPE	WHEN TO USE	DEVELOPMENT
Short push pass (inside of foot)	Close-range, need accuracy, teammate can receive to feet	This develops naturally; focus on weight and timing
Driven pass (laces/instep)	Longer distance, need pace, teammate running onto ball	Introduce around age 8-9 as leg strength develops
Lofted pass	Need to go over opponents, switching play, finding space behind	Introduce around age 10-11; requires technique and strength
Outside of foot pass	Quick release, disguise, angled passes in tight spaces	Emerges naturally in play; encourage experimentation
Chipped pass	Lobbing a nearby opponent, delicate delivery into space	Advanced skill; age 11+ in game contexts

Receiving to Pass

he best passers start passing before they receive. Their body position, their first touch direction, and their awareness all set

T up the pass that follows.

Research on elite players shows they make receiving decisions based on pre-scanned information—they know where they'll play before the ball arrives.

RESEARCH FINDING

"'Elite players' receiving actions were consistently informed by scanning behavior before ball reception, allowing them to execute passes more quickly and accurately than those who assessed options after receiving.'"

McGuckian, T.B., Cole, M.H., & Pepping, G.J. (2018). A systematic review of the technology-based assessment of visual perception and exploration behaviour in association football. Journal of Sports Sciences, 36(8), 861-880.

Receiving to Pass

Open body position

Receive with hips open to the field, not square to the passer

Benefit: Can see forward options, can play multiple directions

Touch away from pressure

First touch moves ball into space, away from nearest defender

Benefit: Creates time and space for quality pass

Across the body when turning

Receive across body to complete turn in one motion

Benefit: Faster transition from receiving to passing forward

Back foot when possible

Receive on back foot to maintain forward momentum

Benefit: Keeps options open, quicker to play forward

Passing by Zone

The value and risk of each pass depends on where it happens. Great players intuitively understand this—they play differently in the defensive third versus the attacking third.

Passing by Zone

Defensive third

Safety-first passing

Don't give the ball away in dangerous areas. Simple, early, secure.

When in doubt, play out. No square balls across the box.

Middle third - defensive half

Build-up passing

Play forward when possible, switch play to create openings.

Look for the diagonal forward pass or switch of play.

Middle third - attacking half

Penetration passing

This is where creativity pays off. Look for through balls, overlaps.

Take risks here. A failed through ball is worth attempting.

Attacking third

Chance creation

Maximum creativity. Final pass or shot.

Be decisive. The killer pass is worth the turnover risk.

Movement and Passing Relationships

A pass isn't just a ball going from A to B. It's part of a relationship between passer, receiver, and space. Great teams develop passing rhythms and patterns that players understand.

The best passing isn't about individual skill—it's about collective understanding of movement and timing.

Key Passing Patterns

Pass and move

After passing, immediately move to a new supporting position

Why: Creates triangles, opens passing lanes, prevents static play

Third-man running

Pass to one player, who sets it to a third player running into space

Why: Bypasses defenders, creates penetration, uses momentum

Overlapping

After passing wide, run outside and beyond the receiver

Why: Creates numerical advantage, width, crossing opportunities

Give and go (1-2)

Pass, sprint past defender, receive return pass

Why: Quick combination to beat a defender

These patterns should emerge from game play, not be drilled in isolation. Small-sided games naturally create the conditions for these combinations to develop.

The Machine with a Heart

Toni Kroos and the Beauty of Consistency

When Toni Kroos retired in 2024, he did so with one of the most remarkable records in football history: six Champions League titles, a World Cup, and passing accuracy statistics that seemed almost impossible.

Throughout his career, Kroos completed approximately 92% of his passes. In some games, he touched the ball over 150 times. In the 2014 World Cup semifinal, he touched it 142 times and misplaced only three passes.

But here's what made Kroos truly special: it was never just about safe passes.

"People say I just pass sideways," Kroos noted in response to critics. "But if you watch, you'll see I pass forward constantly—I just don't give the ball away doing it."

The secret was in his preparation. Former teammates described how Kroos would walk through the stadium before games, visualizing the spaces he would find, the passes he would make. In training, he was obsessive about body position, always receiving in a way that allowed him to play forward.

His coach at Bayern Munich, Pep Guardiola, called him "the most reliable player I've ever worked with. You know exactly what you'll get, every single game. He sees the game three moves ahead."

For young players, Kroos represents the power of mastering the fundamentals. He didn't have the flair of some players or the pace

of others. What he had was an extraordinary command of the basics—body position, weight of pass, awareness—executed with absolute consistency.

His career proved that you don't need to be flashy to be world-class. Sometimes the most beautiful thing in football is a perfectly-weighted pass that finds its target, again and again and again.

"I try to play simple. The most simple is often the most effective." — *Toni Kroos*

Seeing the Game Through Passing

Johan Cruyff — Barcelona Legend, Revolutionary Coach

Johan Cruyff changed football twice—first as a player, then as a coach. His philosophy at Barcelona's La Masia academy created a generation of passers: Xavi, Iniesta, Messi, and countless others.

Cruyff's insight was radical for its time: technique without understanding is worthless.

"What is skill?" Cruyff once asked rhetorically. "Skill is passing at the right time, at the right speed, to the right foot. It is not juggling or doing tricks."

At La Masia, young players didn't practice passing in lines. They played games—rondos, positional games, small-sided matches—where passing was necessary to solve problems. The technique developed in service of the game, not separate from it.

Cruyff was famous for his "rondo"—the keep-away circle that has since become standard at clubs worldwide. But his innovation wasn't the exercise itself; it was what he demanded of players during it.

"One touch is faster than two," Cruyff taught. "But only play one touch if you've already looked. Otherwise, two touches is not slow—it's smart."

He taught players to make decisions before the ball arrived: if you know what you're going to do, one touch is possible. If you don't, take two and stay in control.

For coaches at any level, Cruyff's message is clear: don't teach passing in isolation. Create games where good passing is the solution to a problem. Let the players discover why passing matters, not just how to do it.

"Playing football is very simple, but playing simple football is the hardest thing there is." — *Johan Cruyff*

Key Principle: Technique serves understanding, not the other way around.

PART FOUR

Building the Skill

From First Touch to Mastery

Now we apply the research. This section provides age-appropriate activities that use constraints-led learning, external focus cues, and appropriate challenge levels.

Stage 1: Ball Comfort and Basic Passing

4-6
years

Focus: Joy of kicking, basic concepts of pass/receive

Research Basis: Deliberate play emphasis (Côté, 2007); intrinsic motivation foundation

Guiding Principles

- 100% play-based; no formal passing drills
- Kicking is fun! Goal is enjoyment and exploration
- Basic concept: send ball to a friend, receive it back
- No corrections on technique—let discovery happen

Activities

Knock Down the Cones

5-10 min

Set up cones or water bottles. Players try to knock them down by kicking the ball. Vary distances. Can compete against themselves or friends.

Focus: Accuracy, cause and effect of kicking

External Cue: *"Can you knock it down from here?"*

Partner Keep-Away

5-8 min

Two players pass between each other while a third (or parent) tries to intercept. Switch roles.

Focus: Sending ball to a person, avoiding obstacle

External Cue: *"Can you get the ball to your friend before I touch it?"*

Ball Sharing

10 min

Free play in an area. When coach calls 'share!' players must pass to someone nearby. Continue playing.

Focus: Awareness of others, basic passing in movement

External Cue: *"Find a friend and give them the ball!"*

Goals Everywhere

10 min

Set up many small goals (cones, 1yd wide) around an area. Players dribble and try to pass through any goal. Count how many!

Focus: Accuracy, looking around, dribble-to-pass connection

External Cue: *"How many goals can you score through?"*

At-Home Activities for Parents

- Roll and pass back and forth while sitting on the ground
- Kick toward a wall target, receive the rebound

- Pass through furniture 'goals' in the house
- Gently kick back and forth while walking together

Signs of Progress

- ☐ Enjoys kicking and passing activities
- ☐ Can usually get the ball to a nearby partner
- ☐ Starting to understand pass = give ball to someone
- ☐ Celebrates when passes connect

Stage 2: Passing With Purpose

7-9 years

Focus: Weight of pass, receiving to play forward, basic scanning

Research Basis: External focus of attention (Wulf, 2013); game-based learning (Ford et al., 2010)

Guiding Principles

- 70% play-based, 30% guided discovery
- Introduce weight of pass: too hard, too soft, just right
- Encourage head-up before receiving
- All passing should include movement and/or context

Activities

Passing Gates

8-10 min

Pairs pass through gates (cone goals) scattered around area. Move to different gates. Count successful passes. Competition: which pair scores most?

Focus: Accuracy, weight, looking for targets

External Cue: *"Can your pass reach your partner through the gate?"*

Variation: Make gates different widths—harder = more points

3v1 Keep Away (Rondo)

10-15 min

Three players keep ball from one defender in small square. Simple: unlimited touches. Harder: 2-touch, then 1-touch.

Focus: Quick decisions, support positioning, weight of pass

External Cue: *"Pass to the player who is free"*

Note: Rotate defender frequently. Let learning happen through play.

Numbers Scanning Game

10 min

Players pass in groups of 4. Before receiving, they must look at coach and call out number of fingers shown. Then play continues.

Focus: Scanning before receiving

External Cue: *"Can you see my fingers before the ball arrives?"*

4v4 with End Zones

15-20 min

Score by receiving pass in end zone, not by dribbling in. Forces passing to complete scoring action.

Focus: Penetrating passes, timing, communication

External Cue: *"Look for your teammate running into the end zone"*

At-Home Activities for Parents

- One-touch passing against a wall (see how many in a row)
- Pass and follow: pass, then run to where ball went
- Play 1v1 where scoring requires a pass through a goal
- Watch professional games together—notice passing patterns

Signs of Progress

- ☐ Adjusts weight of pass to match distance
- ☐ Starts looking up before receiving sometimes
- ☐ Can complete simple 1-touch passes when ready
- ☐ Starting to pass to space, not just to feet
- ☐ Enjoys rondo-style games

The Patience to Develop Passers

Arsène Wenger — Former Arsenal Manager, Pioneer of Youth Development

When Arsène Wenger arrived at Arsenal in 1996, English football was known for physicality, not passing. Wenger changed that—not just at Arsenal, but across the country.

His approach was built on patience and belief.

"A player who can pass," Wenger said, "is a player who can think. And thinking can be developed."

Wenger famously took players others had given up on—players told they were too small, too slow, too weak—and developed them into world-class passers. Cesc Fàbregas arrived at Arsenal as a 16-year-old and became one of the league's best passers within two years.

The secret? Wenger's training emphasized decision-making over repetition. "I never wanted players to pass for the sake of passing," he explained. "I wanted them to understand why a pass was right or wrong. The execution follows the understanding."

His teams became known for their flowing, passing football—a style that seemed almost too beautiful for the rough Premier League. But it worked because Wenger understood something essential: technique without intelligence is just tricks, but intelligence with good enough technique can dominate games.

For parents watching their children develop, Wenger's career is a reminder that the best passers are often made, not born. The small player who can't outrun defenders might become the one

who doesn't need to—because they always know where the ball should go.

"A football team is like an orchestra. Every player must know when to play and when to let others play." —
Arsène Wenger

Key Principle: Intelligence can be developed. Patience makes it possible.

Stage 3: Passing Intelligence

10-12 years

Focus: Scanning habits, decision-making, receiving to play forward

Research Basis: Perceptual-cognitive development (Williams & Ward, 2003); scanning research (Jordet, 2013)

Guiding Principles

- 50% play-based, 50% structured (game-realistic)
- Scanning is explicitly developed and reinforced
- Every practice includes small-sided games
- Passing decisions are discussed, not just techniques

Activities

Scanning Rondo (4v1 + Target)

12-15 min

4v1 keep away, but there's a target player outside the square. Before playing to target, passer must call out their shirt color or name. Target plays back in.

Focus: Scanning for forward option, playing forward when possible

External Cue: "Check the target before the ball arrives"

Progression: Add second target; must pick correct one based on visual cue

Directional Passing Game

20 min

5v5 with directional goals (can only attack one way).
Team scores by passing to teammate in end zone.
Encourages forward passing and movement.

Focus: Forward passing, combination play, movement off ball

External Cue: *"Can you find the forward pass?"*

Note: Debrief: What made passes forward possible?
Movement? Body shape?

Switch Play Challenge

15-20 min

4v4+2 (two neutral wide players). Team earns bonus point for switching play from one side to other. Full field width.

Focus: Vision, changing point of attack, lofted passes

External Cue: *"Can you see the other side when it's open?"*

Receive to Play Forward

15 min

3v3 in tight area. One end has 'forward goal' (passing to player in zone). Players practice receiving open, turning when possible.

Focus: Body shape when receiving, turning under pressure

External Cue: *"Can you receive facing forward?"*

Debrief: When could you turn? When did you need to go back?

Signs of Progress

- ☐ Scans before receiving as a habit
- ☐ Body position when receiving allows multiple options
- ☐ Plays forward when the option exists
- ☐ Can explain why they chose a particular pass
- ☐ Shows different passes for different situations

Video Analysis Introduction

Watch 5-10 clips of professional midfielders receiving and distributing. For each, note: body position, head movement before receiving, choice of pass.

Players to watch: Pedri (body positioning), Kevin De Bruyne (vision and weight), Joshua Kimmich (scanning), Toni Kroos (composure and precision)

Frequency: Every 2 weeks

Stage 4: Mastery and Game

13+
years

Intelligence

Focus: Refined technique, advanced decisions, pressure performance

Research Basis: Expertise development (Ericsson); pressure training (Beilock)

Guiding Principles

- Training intensity matches or exceeds game demands
- Technical refinement in context, not isolation
- Mental skills integrated into passing practice
- Individual style development within team principles

Activities

High-Tempo Possession

20-25 min

7v7 or larger with possession targets (e.g., 10 passes = 1 point, or pass to each player = 1 point). Time limit creates urgency.

Focus: Quick decisions, one-touch play, scanning under time pressure

External Cue: ""

Playing Out Under Press

20 min

6v6 with one team pressing high. Team in possession builds from back and scores in mini-goals at halfway line.

Focus: Composure, passing under pressure, finding free player

External Cue: ""

Position-Specific Passing

15 min

Based on player's position, focus on relevant passing scenarios: center backs' distribution, midfielder's forward passes, wingers' switches.

Focus: Role-specific decision-making

External Cue: ""

Combination Play Finishing

20 min

Groups of 3-4 work on specific combinations (overlaps, 1-2s, third-man runs) progressing to shot. Competition for goals scored.

Focus: Passing rhythm, timing, finishing under game-like pressure

External Cue: ""

Variation: Add passive then active defenders

Mental Skills Integration

Pre-reception routine: Consistent scan pattern before every touch: check shoulder, assess, receive

Composure cues: Self-talk under pressure: 'I have time,' 'Find the simple ball,' 'Trust it'

Post-mistake routine: Quick reset after turnover—next action focus, not dwelling on error

PART FIVE

The Parent's Role

Supporting Development Without Coaching

Your reactions, questions, and the environment you create at home all shape your child's development as a passer—and as a player who enjoys the game.

The Research on Parent Influence

Studies consistently show that parent behavior significantly impacts both skill development and enjoyment.
Key findings:

Children whose parents emphasize effort and learning (rather than outcomes) develop better, persist longer, and enjoy the game more.

Sideline coaching from parents increases anxiety and often contradicts the coach's instructions.

The most supportive parents are calm, positive, and let the game belong to the child.

RESEARCH FINDING

""Positive parental involvement characterized by support, appropriate expectations, and child-focused (rather than outcome-focused) behavior is associated with continued participation and healthy development.""

What to Do

✓ Create opportunities for play

Why: Unstructured play—especially small-sided games with friends—is where passing skills develop naturally

How: Organize informal games, take them to the park, have balls available at home

✓ Play with them

Why: Passing requires a partner! Playing together builds skill and relationship

How: Simple passing in the backyard, wall work together, watching games and discussing

✓ Ask questions instead of instructing

Why: Self-reflection builds deeper understanding than being told what to do

How: 'What did you notice when you had time?' not 'You should have looked up'

✓ Praise the process

Why: Praising effort, decision-making, and improvement builds growth mindset

How: 'I noticed you were looking up more today' rather than 'Nice assist'

✓ Be a calm presence

Why: Your emotional state transfers to them; calm parents = calmer players

How: Watch with interest, not anxiety. Clap for effort, not just successful passes

What to Avoid

✗ Coaching from the sideline

Why it hurts: Creates confusion, undermines the coach, increases anxiety

Instead: Save observations for calm conversations later

✗ Commenting on every pass

Why it hurts: Heightens self-consciousness, reduces enjoyment

Instead: Let them play. They know when passes work or don't

✗ Comparing to teammates

Why it hurts: Creates unhealthy comparison, reduces intrinsic motivation

Instead: Focus only on their own development

✗ Overemphasizing possession stats

Why it hurts: Safe passing isn't always good passing; risk-taking is important

Instead: Value forward passes that don't work as learning opportunities

✗ Car ride debriefs

Why it hurts: The drive home becomes associated with evaluation anxiety

Instead: 'Did you have fun?' Let them bring up the game if they want

Home Activities by Age

Ages 4-6

Ages 7-9

Ages 10-12

- Roll ball back and forth on the floor together
- Kick toward a wall and collect the rebound
- Set up 'goals' with household items; pass through them
- Simply play with them—kicking around in any open space

- Wall passing: see how many in a row without losing control
- 1v1 games where scoring requires passing through a target
- Watch games together, discuss what players do
- Informal games with friends, siblings, neighbors

- More advanced wall work: one-touch, alternating feet
- Play 2v2 or 3v3 with friends/family
- Watch specific players known for passing; discuss what makes them good
- Support their own practice goals

Conversation Starters

INSTEAD OF...	TRY...
"Why did you pass it backwards?"	"What were your options on that play?"
"You should have passed to Jake"	"What did you see when you got the ball there?"
"Your passing was good/bad today"	"What did you work on today? What was fun?"
"Did you get any assists?"	"Did you try anything new today?"
"You need to look up more"	"What's something you want to work on next time?"

About Aspire Sports

Aspire Sports is dedicated to transforming youth sports through evidence-based coaching and development practices. We believe every child deserves access to quality sports education that builds skills, confidence, and a lifelong love of movement.

Our programs are built on the latest research in motor learning, sports psychology, and child development. We train coaches to create environments where young athletes can thrive—developing not just as players, but as people.

Our Mission

To provide every young athlete with the opportunity to develop their full potential through research-based coaching, age-appropriate training, and a positive, supportive environment.

Our Values

- **Long-Term Development** — Building skills over years, not rushing results
- **Evidence-Based** — Grounded in research, not tradition
- **Child-Centered** — Meeting kids where they are
- **Joy First** — Making sports fun keeps kids playing
